NASA RECOVER 2.0

Post-fire Decision Support System

Keith T. Weber, GISP (PI), ISU GIS TReC

Brad Quayle (Co-PI), USDA Forest Service GTAC

ROAR

What is RECOVER 2.0?

- A Cloud-based platform for Post-wildfire management and long-term monitoring
- RECOVER 2.0 is a Customer-driven, Customer-centric* Decision Support System (DSS)

* Our “customers” are agency/organizational wildfire and land managers at the USDA Forest Service, DOI BLM, NPS, NWS, as well as state agencies, and county emergency managers

Enhancements Provided by RECOVER

- Rapid spatial data acquisition specific to post-wildfire events
- Cross-organizational collaboration
 - RECOVER breaks down silos
- Common Operational Picture (uniform spatial context)

Data Architecture

- **Base Layers** with wall-to-wall coverage across the Western USA ($n = 37$)
- Use of authoritative data
- Automated processing using our **Large Fire Trigger**
- Delivers **RECOVER Data Packages**
- Leverages Esri's ArcGIS Online (AGOL) cloud and Portal

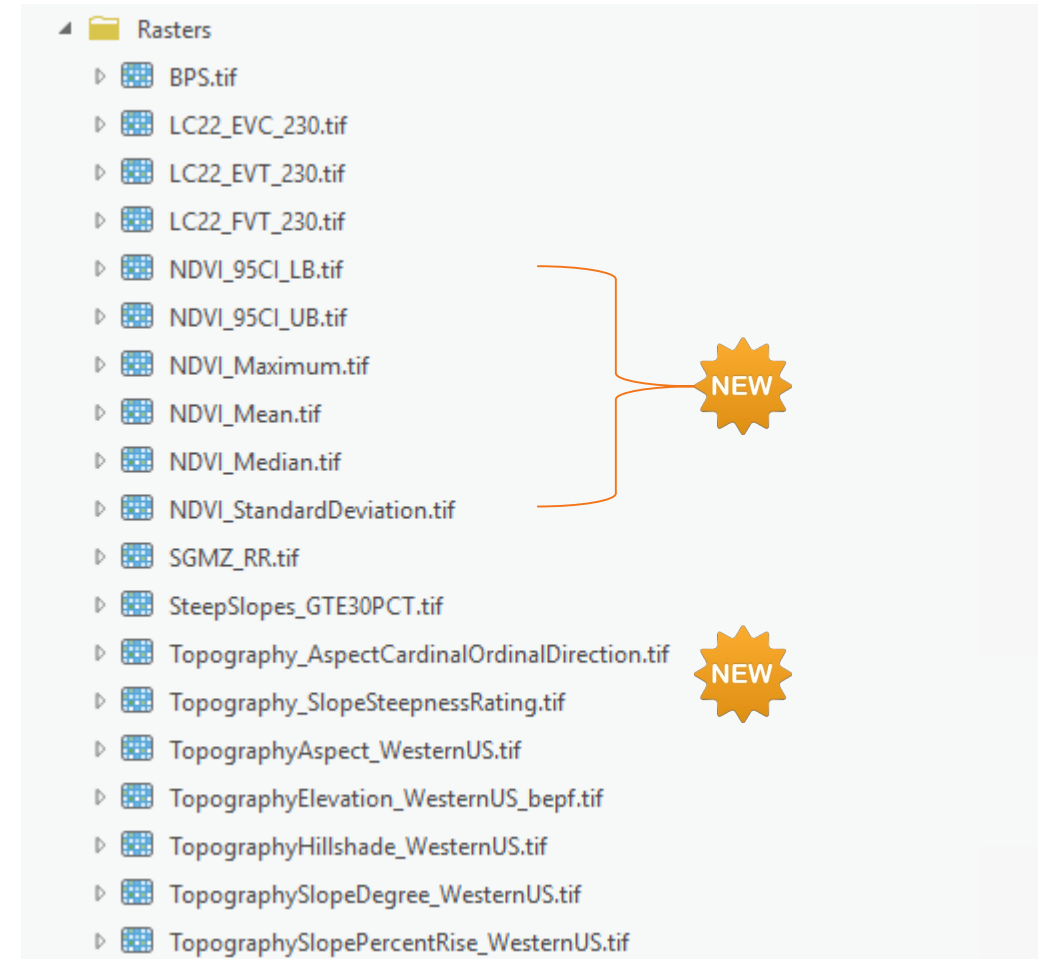

RECOVER Base Layers

- Updated SSURGO base layer including Hydrologic Soil Group data (in support of request from USACE)

Plus four additional web service streams provided in Layer files (LYRX)

Plus

- Automated **Executive Summary Reports** for each fire
- Long-term post-fire monitoring using NASA satellite imagery
 - ✓ Step one: Develop a decade long baseline NDVI from Landsat imagery (over 18,000 scenes processed)
 - ✓ Step two: Create a multi-dimensional image service of these data
 - ✓ This service can be used in a web map or in the desktop
 - ✓ Step three: Develop an web interface and tutorial to determine baseline conditions within a fire area
 - Step four: Automate collection of current NDVI imagery for the fire area to compare to the long-term trend

More About the NDVI Baseline

- Provides you with mean, **median**, minimum, maximum, standard deviation, and both upper and lower bound 95% CI data layers
