

A Method of Modeling Sagebrush-steppe Landscape Structure Using Fuzzy Classification Techniques

Joel Sauder

Idaho State University

GIS Training and Research Center

Land Cover Mapping Efforts

- National Land Cover Data (NLCD)
- Gap Analysis Program (GAP)

Hard Classifiers

“All [hard classifiers are] based on a logic that describes the expected position of a class [based on training data] in what is know as ‘band space,’ and then gauges the position of each pixel to be classified in the same band space relative to the training class.”

(IDRISI 1997)

Hard Classifier Examples

- Minimum Distance
 - uses mean and standard deviation
- Maximum Likelihood
 - uses mean and variance/covariance

Problems with Hard Classifiers

- Membership of a pixel to a class is unknown.
- Many training classes needed in habitats that exhibit diverse structural characteristics.

Soft Classifiers

“Refrain from making definitive judgements about class membership of any pixel. Instead they produces statements about the degree of membership a pixel has to each possible classification.”

(IDRISI 1997)

Soft Classifier Examples

- Bayesian Classification
 - based on Bayesian Probability Theory
- Fuzzy Classification
 - based on Fuzzy Sets

An Analogy

Hard classifier
classifier

vs.

Soft

Apple

Apple =
1.0

Orange

Orange = 1.0

Hard classifier
Apple

vs.

Soft

Apple = .90

Orange = .10

Apple

Apple = .80

Orange =
.20

Orange

Orange =
.90

Apple = .10

Orange

Orange = .80

Apple = .20

Hard classifier
classifier
Apple

vs.

Soft

Apple = .70

Orange =

Apple ?

Apple = .60

Orange = .40

????

Apple = .50

Orange = .50

Orange ?

Apple = .40

Orange = .60

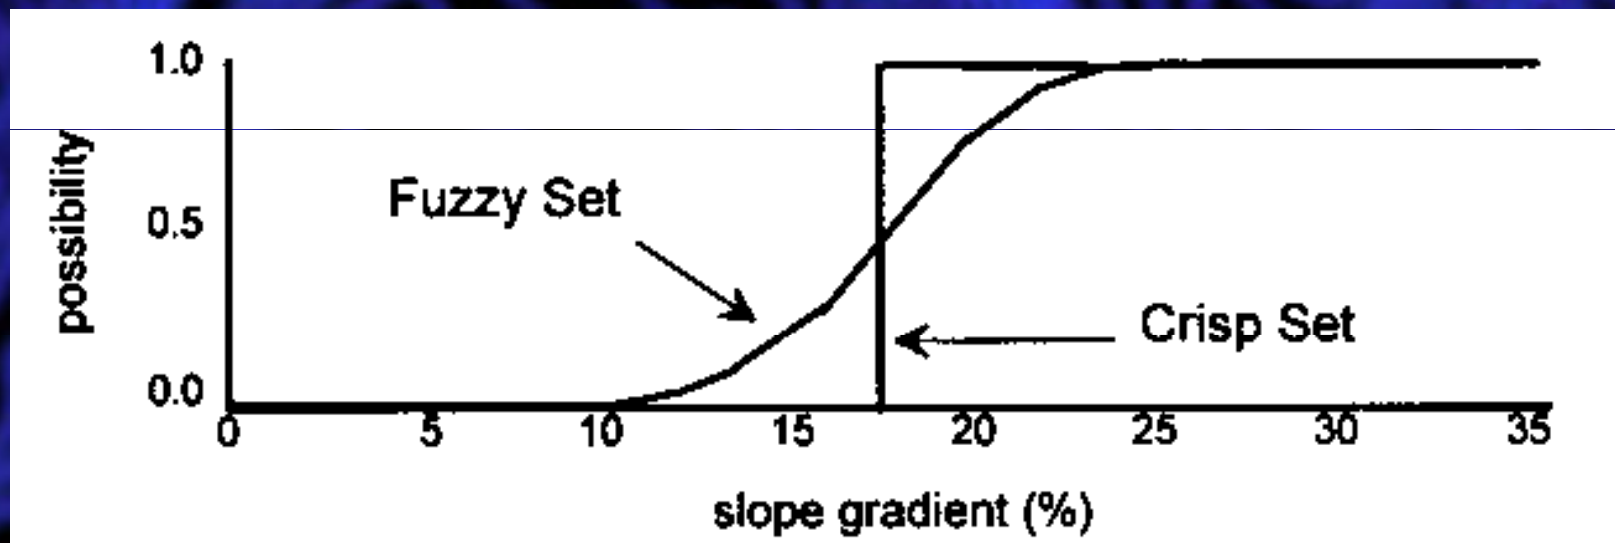

Orange

Apple = .30

Orange
= .70

Fuzzy Sets

Sagebrush-steppe

Sage Grouse

- Sagebrush cover

- High (>25%)
- Moderate (15-25%)

- Low (<15%)

Connelly et.al
2000

Project Goals

- Improve classification accuracy of Sagebrush-steppe areas using fuzzy classification techniques.

Project Applications

- Identify areas of high ($>25\%$), moderate ($15-25\%$) and low ($<15\%$) sagebrush cover.

Methods & Materials

- 1997 Landsat 5 TM imagery
- Training sites of dense grass and sagebrush

- Fuzclass procedure in IDRISI 2.0

Results

(membership = .0 - 1.0)

Sagebrush

Grass

Uncertainty

Results

Results cont.

Fuzzy Class Membership

Sagebrush

Grass

High : 100

Low : 0

High : 100

Low : 0

Summer 2002

- Collect field data to validate the model.
- Correlate membership grades to abundance of sagebrush and grass cover.
- Rebuild the model using 2000 Landsat data.
